

IoT Device Privacy: A Comprehensive Review of Physical Components and Configuration Settings

BAYAN AL MUHANDER

OMER RANA

CHARITH PERERA

Privacy Settings of IoT with Physical Components

The proliferation of Internet of Things (IoT) devices has significantly transformed the landscape of smart home technology, offering unprecedented levels of convenience, automation, and connectivity. This report aims to provide a comprehensive analysis of 100 IoT devices, focusing on their availability in the University Smart Home Lab and the presence of physical components. By examining these aspects, the report seeks to offer valuable insights into the usability, control interfaces, and data management practices of these devices, which are crucial factors for both end-users and developers.

The report is structured into two main sections. The first section presents a detailed table listing all 100 IoT devices, sorted based on their availability in the University Smart Home Lab and whether they include physical components. The second section focuses on the subset of 30 devices that have physical components such as buttons, knobs, and sliders. This section includes a table categorising these devices by their physical components and their apps' privacy settings, including sharing, usage, and retention configurations. Each device entry is supplemented with a picture highlighting its physical components and a roadmap guiding users on how to access and configure the app's privacy settings. This structured approach ensures a clear and organized presentation of the data, facilitating easy reference and analysis.

From Our Analysis, We Found That:

- The most common physical components on IoT devices are: **Buttons, Knobs, and Sliders.**
- Most apps provide options to configure usage settings, including **Service Improvement** and **Targeted Advertising.**
- Some apps offer additional privacy options for **Data Sharing** and **Data Retention.**
- Most apps display their legal and terms of use as a website privacy policy.

Table 1: Overview of 100 IoT Devices Sorted by Availability in University Smart Home Lab and Physical Components.
